Introduction to microRNA computational analysis

Hatzigeorgiou Artemis

AR Rinn JL, Chang HY. 2012.
 Annu. Rev. Biochem. 81:145–66

What are microRNAs (miRNAs)?

miRNAs are about 22 nt long RNAs.

They post-transcriptionally regulate *protein coding* gene expression

MicroRNAs are involved in ...

Development

stem cell proliferation

Division Differentiation

regulation of innate & adaptive immunity

apoptosis

cell signaling

metabolism

human pathologies

Cancer viral infections

cardiovascular diseases

metabolic disorders

neurological

pathologies

psychiatric disorders

renal disease

hepatological conditions

autoimmune diseases

gastroenterological conditions

obesity

microRNA

Minimum binding free energy score for mRNA window

Adding conservation

For each miRNA:

A) Keep targets conserved in human / mouse orthologs.

B) Sort all targets based on the minimum free energy binding score

Top 13 targets selected for experiments.

Experimental identification

B

C

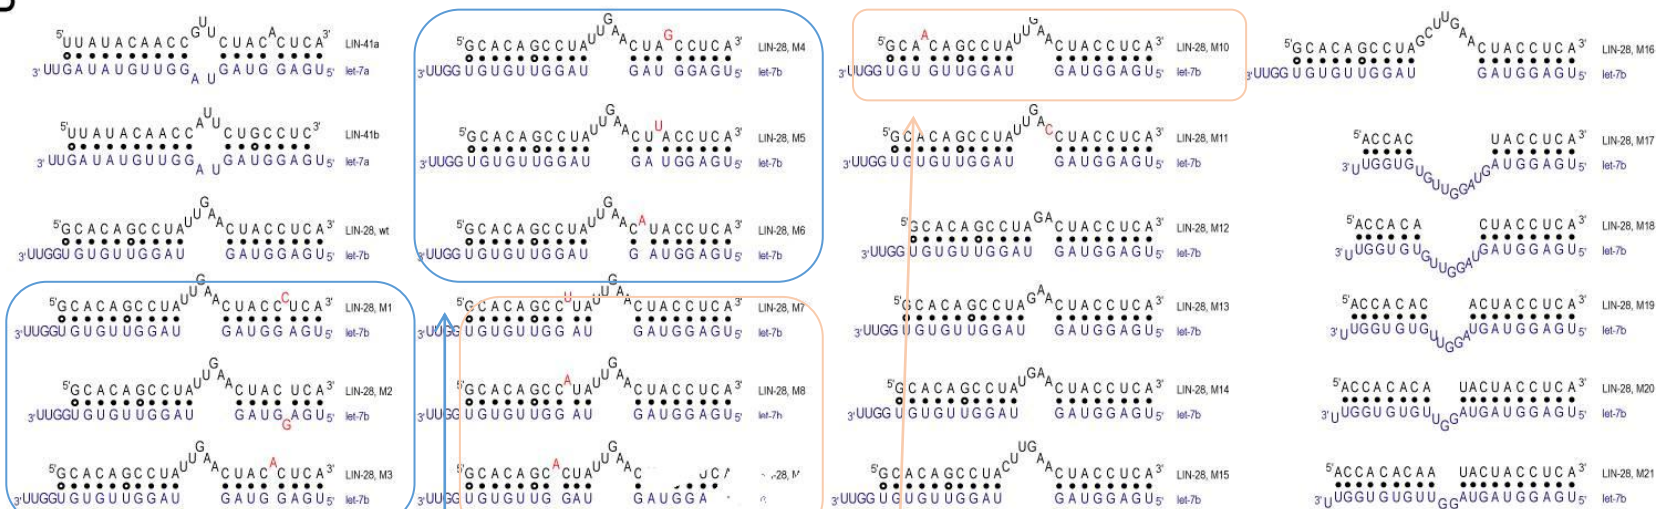

Experimental identification of miRNA binding rules

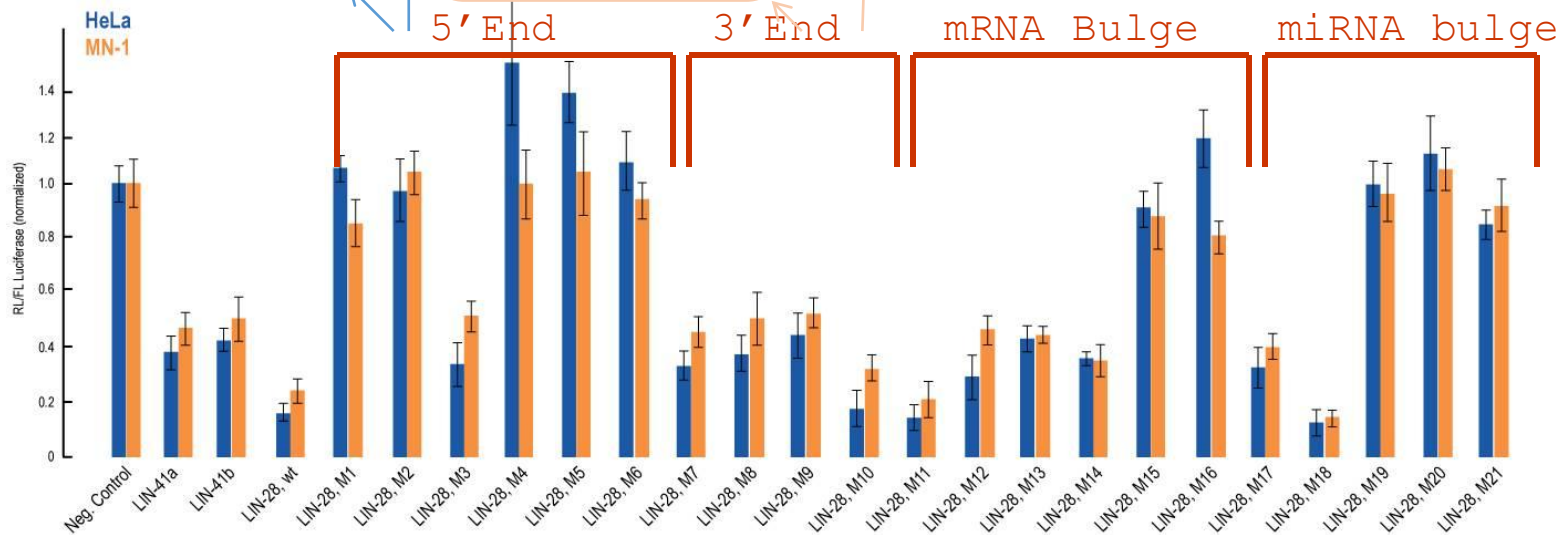

A

B

C

First Binding rules

- Binding on the 5' prime of miRNA important
- Length of central bulge can change
- Binding on the 3' prime of miRNA can be loose

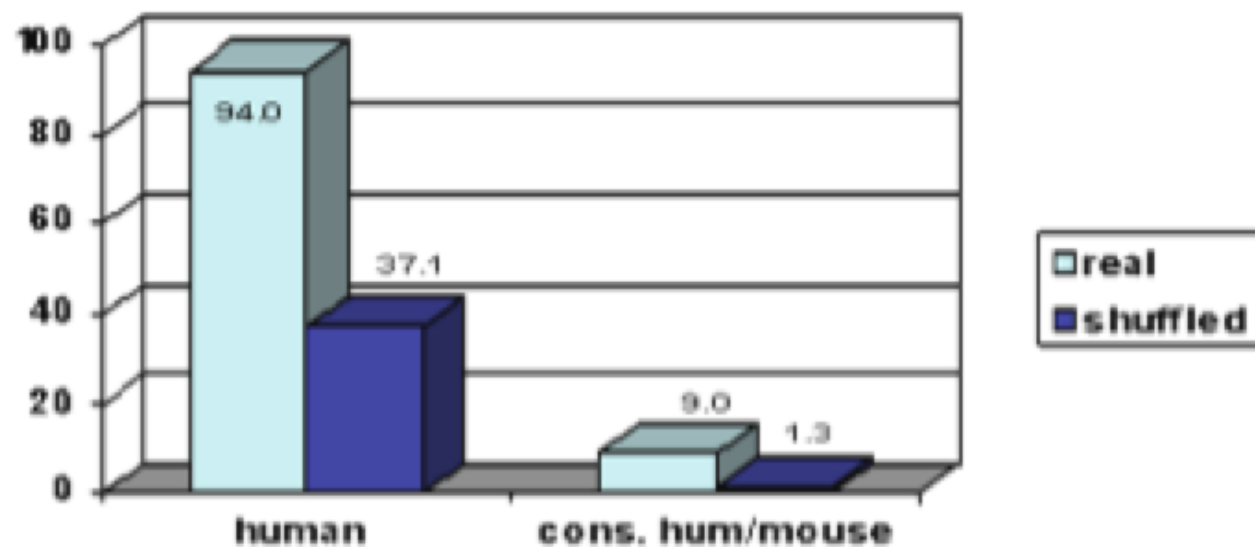

Statistical evaluation of miRNA binding rules

Signal : noise ratio

1. X = # total target site predictions for a set of real miRNAs
2. Y = # total target site predictions for a set of randomized miRNAs
3. $X:Y$ is the signal:noise ratio which provides a measure of specificity

Example

1. $X = 2000$
2. $Y = 1000$
3. Signal:noise ratio is 2:1. For every 2 predicted targets, 1 is likely to be false (50% FPR).

A combined computational-experimental approach predicts human microRNA targets

miRNA:target interaction categories

5'-dominant site

- Perfect base pairing to at least 7 nucleotides starting from the first or second nucleotide at the 5'-end of the miRNA

3'-compensatory site

- Imperfect or shorter stretch of base pairing to at least 7 nucleotides starting from the first or second nucleotide at the 5'-end of the miRNA
- Extensive binding to the 3'-end of the miRNA in order to compensate for the weaker binding to the miRNA 5'-end

miRNA target sites & miRNA:mRNA

Until now

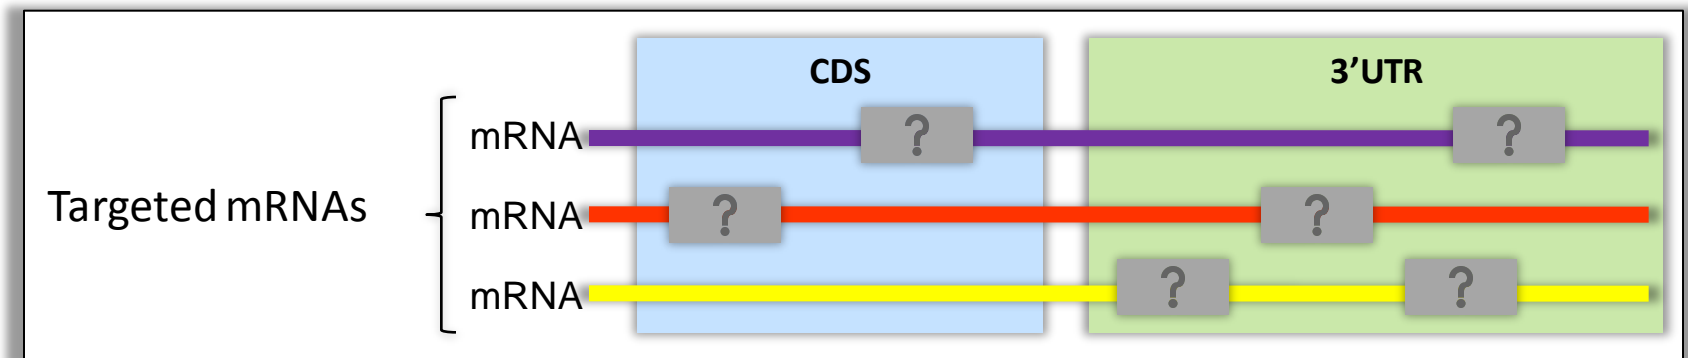

Experimentally identified binding sites

Limited number -> cannot extract statistically significant features

Specific for few miRNAs

Microarrays (mRNA level) or proteomics (protein level)

Target genes are specified but binding sites remain unknown

CLIP data (Chi *et al.* 2009, Hafner *et al.* 2010)

Note

PAR-CLIP (Hafner *et al.* 2010) , HITS-CLIP (Chi *et al.* 2009).

T->C mutation on the tags specifies binding sites within a region of 5 nts.

Before

Experimentally identified binding sites

Limited number -> cannot extract statistically significant features
Specific for few miRNAs

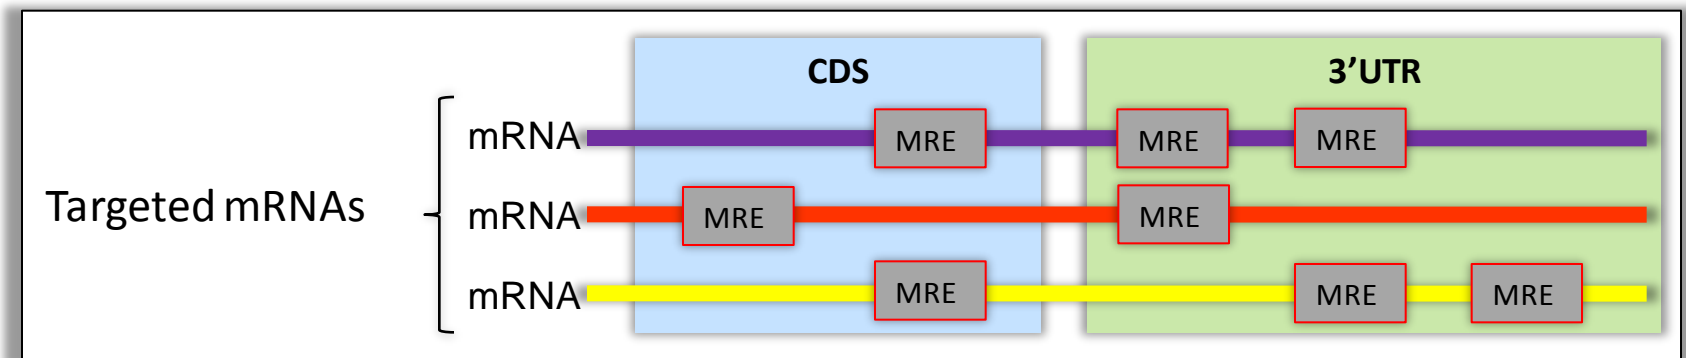

Microarrays (mRNA level) or proteomics (protein level)

Target genes are specified but binding sites remain unknown

Now - Sequencing data (PAR-CLIP, HITS-CLIP)

Specify location of thousands of binding sites

Enable statistical evaluation of several features

How CLIP data are processed

Sequence reads are mapped to genome

Peaks of reads are identified

Peaks indicate binding sites BUT do not specify by which miRNA

For this, the genomic location of the peak is aligned against all known miRNAs and the **best matching miRNA is chosen**

Out of 17310 peaks 5057 overlap with an MRE at the UTR and 6057 overlap with an MRE at the CDS.

Feature Extraction and Analysis

Identified bindingsites are divided into 2 categories

1. **Positive** sites - overlap with PAR-CLIP data
2. **Negative** sites - do not overlap with PAR-CLIP data

More than 150 features are tested to distinguish:

Positive binding sites
(CLIP data)

vs

Negative binding sites

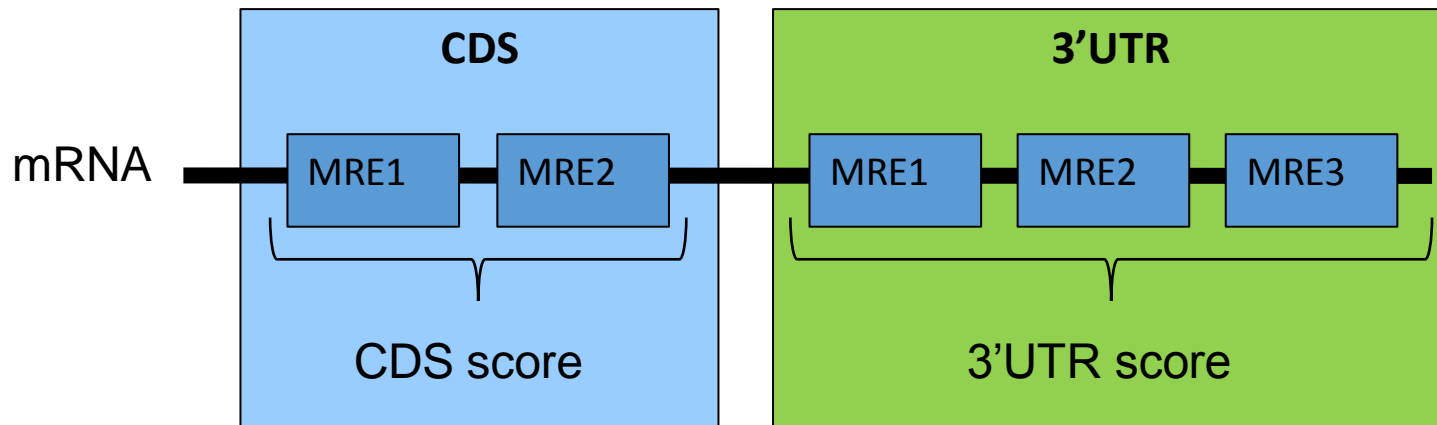

Flanking AU content

e.g.

MicroT – CDS

A combination of MRE scores in CDS and 3'UTR regions

MRE scores in each region are combined to a region score

Integration of CDS score and 3 UTR score with a generalized linear model

Does targeting in CDS improve prediction performance?

Including targeting in CDS improves sensitivity by more than 12%

- 300 targets per miRNA that would be lost otherwise

Abstract link: [20735361](#) **Score:** 11

Title: [Identification of microRNAs expressed highly in pancreatic islet-like cell clusters differentiated from human embryonic stem cells.](#)

Journal: Cell biology international (Cell Biol. Int.),

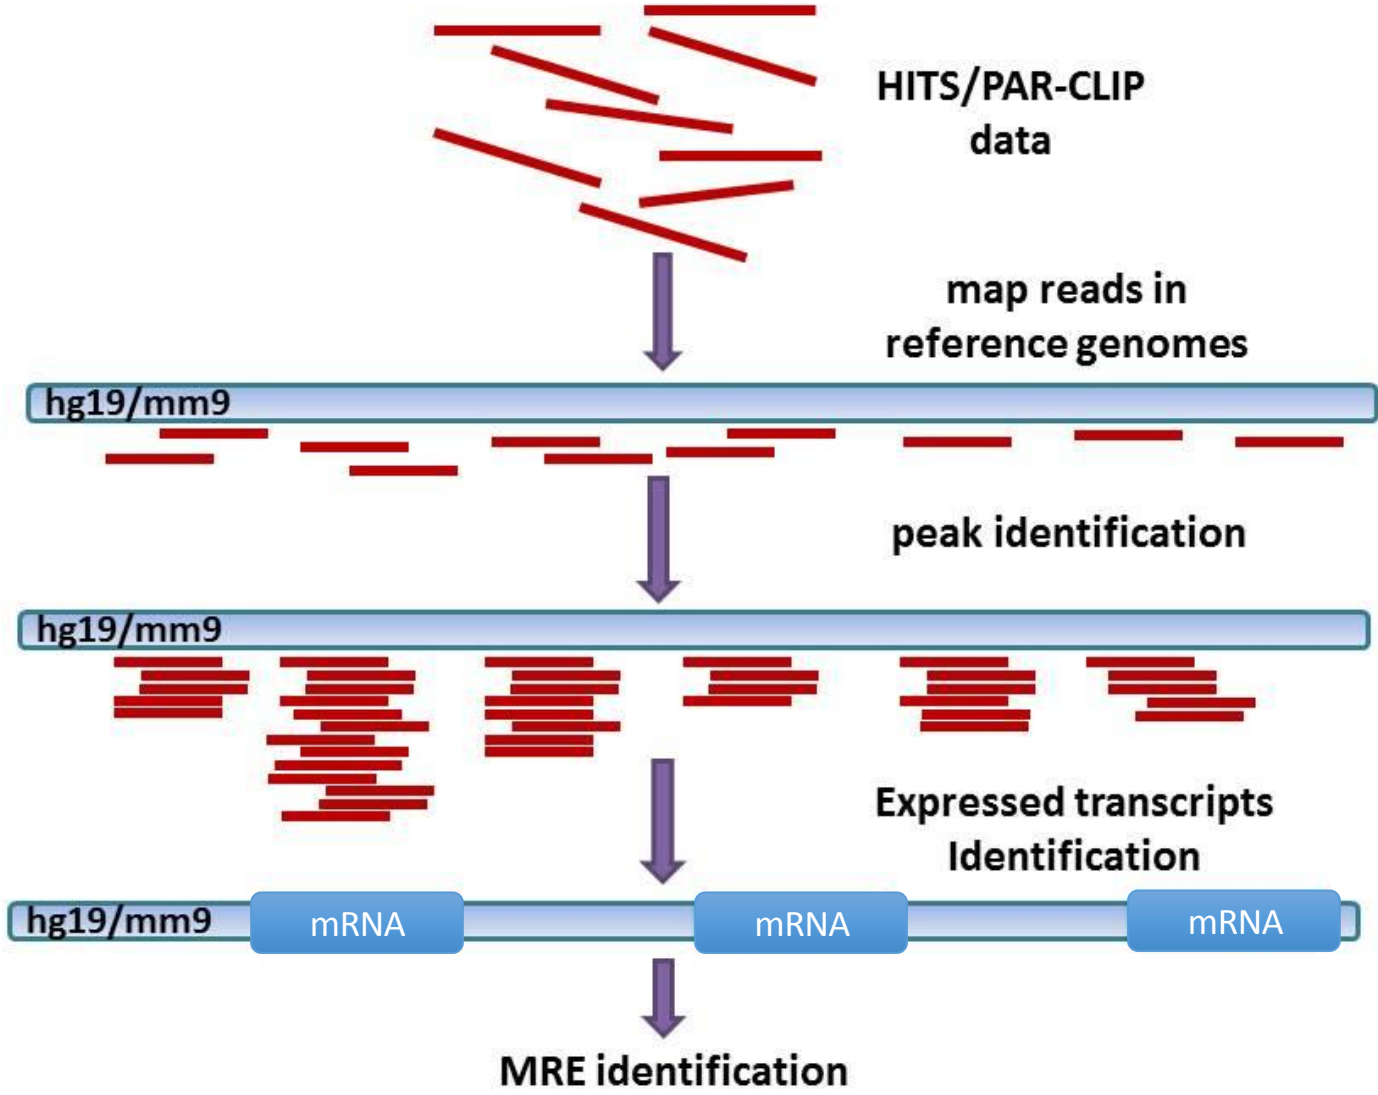

ISSN: 1065-6995, **Date:** 01 / 12 / 2010

Identification of microRNAs expressed highly in pancreatic islet-like cell clusters differentiated from human embryonic stem cells. Type 1 diabetes is an autoimmune destruction of pancreatic islet beta cell disease, making it important to find a new alternative source of the islet beta cells to replace the damaged cells. hES (human embryonic stem) cells possess unlimited self-renewal and pluripotency and thus have the potential to provide an unlimited supply of different cell types for tissue replacement. The hES-T3 cells with normal female karyotype were first differentiated into EBs (embryoid bodies) and then induced to generate the T3pi (pancreatic islet-like cell clusters derived from T3 cells), which expressed pancreatic islet cell-specific markers of [insulin](#), [glucagon](#) and [somatostatin](#). The expression profiles of microRNAs and mRNAs from the T3pi were analyzed and compared with those of undifferentiated hES-T3 cells and differentiated EBs. MicroRNAs negatively [regulate](#) the expression of protein-coding mRNAs. The T3pi showed very high expression of microRNAs, [miR-186](#), [miR-199a](#) and [miR-339](#), which down-regulated the expression of [LIN28](#), [PRDM1](#), [CALB1](#), [GCNT2](#), [RBM47](#), [PLEKHH1](#), [RBPMS2](#) and [PAK6](#). Therefore, these microRNAs and their [target](#) genes are very likely to play important [regulatory](#) roles in the development of pancreas and/or differentiation of islet cells, and they may be manipulated to [increase](#) the proportion of beta cells and [insulin](#) synthesis in the differentiated T3pi for cell therapy of type I diabetics.

Weber^{f,g}, Michael J. Birrer^e, Artemis G. Hatzigeorgiou^{c,f,i,k}, Carlo M. Croce^{c,d}, and George Coukos^{a,b,c,f}

Numerous miRNAs and protein coding genes are downregulated in late stage ovarian cancer.

MiRNA downregulation affects mRNA transcripts?

(miRNA = DOWN & targets = UP)

Calculating the hexamer distribution in the UTR's of genes that gain expression(UP) and genes that do not change(OTHER)

TATGAT	7.52	248	hsa-miR-376b	1
TATGAT	7.52	248	hsa-miR-376a	1

The majority of the downregulated miRNAs are located at a big miRNA cluster (< 36) at the Dlk1-Gtl2 domain of chr. 14.

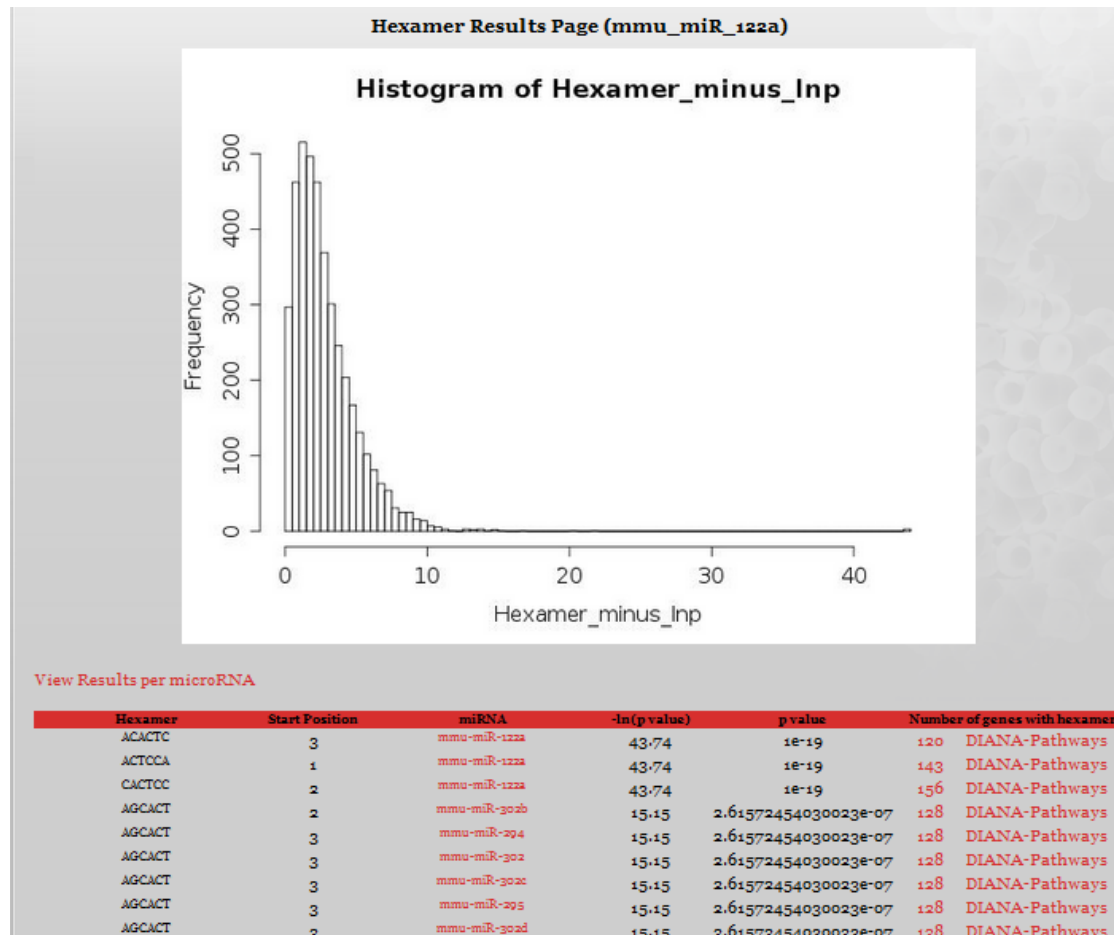

Downregulation of miRNA cluster at *DLK1-GTL2* domain is associated with poor survival.

WEB SERVICES

Web Services at DIANA-LAB

DIANA-LAB enables access to the tools and data resources via Web Service Technologies. REST services are now provided for [mirPath](#), [microT v4](#), [microT-CDS](#) and [Tarbase v6.0](#). All REST Services can be accessed directly from the website, programmatically, by downloading our [DIANA Taverna Plug-in](#). Our REST Services have also been deposited in the BioCatalogue repository, where detailed information for their usage is provided ([here](#)).

SOFTWARE TO DOWNLOAD

[DIANA Taverna Plug-in](#)

WEB APPLICATIONS

microT-CDS

Search for targets of annotated miRNAs based on microT-CDS algo.

TarBase v7.0 - NEW!

A database of published exp. validated miRNA:gene interactions.

mirPath

A miRNA pathway analysis Web server.

LncBase

Elaborated info for predicted & exp. verified miRNA-lncRNA interactions.

Automated Pipelines

Pipelines to analyse user data from small scale & high-throughput experiments.

MR-microT (beta) - NEW!

Near-real time miRNA target prediction on the Cloud.

mirPub - NEW!

Search for miRNA-related publications.

Tarbase v6.0

Older version of TarBase database.

microT v4

Older version of microT application & algorithm.

OTHER WEB APPLICATIONS

[DIANA microT v3.0](#)

[DIANA mirExTra](#)

[DIANA miRGen 2.0](#)

EDITING

Editing of tissue specific adenosine to inosine (A->I) of mir-376 cluster.

Editing by ADAR can almost completely alter miRNA targeting activity (I pairs with G)

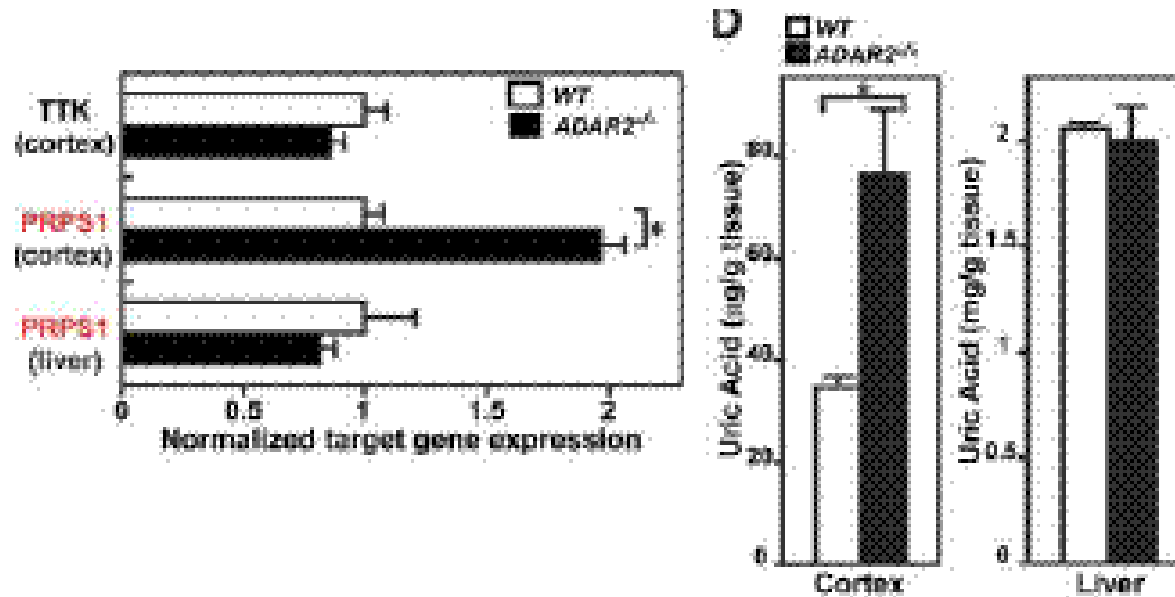

pre-miR-376a

Kawahara, Y., Zinshteyn, B., Sethupathy, P., Iizasa, H., Hatzigeorgiou, A.G., and Nishikura, K. (2007) Redirection of silencing targets by adenosine-to-inosine editing of miRNAs. *Science* Feb 23;315(5815):1137-40.

Analysis of expression levels of mir-376a-5p targets in the WT and ADAR2^{-/-} mouse.

- PRSP1 is involved in purine metabolism and the Uric Acid synthesis pathway.
- Increase of PRSP1 levels cause a human disorder characterized by gout and neuro developmental impairment with hyperuricemia.

SNPs & miRNAs

Polymorphic disease associations and microRNAs.

- SNPs that occur in functional miRNA target sites could affect miRNA binding
- Map all annotated SNPs from dbSNP onto all experimentally supported target sites from TarBase
- 2 of the 5 SNPs occur in a region that disrupts the 5'-dominant binding
- 1 of these 2 SNPs is genotyped according to **ALFRED** (ALlele FREquency Database)
- Does this SNP impair miR-155 binding and silencing of *AGTR1*?
